

Sentinel — Government Sandbox Grid Capture Report

Source host: 103.250.160.189 | Capture window start (UTC): 2026-09-14T15:25:03.750499+00:00 | Duration: 10s | Plate-format-valid detections: 0 (of 16 raw ANPR detections)

This table lists only detections that pass Indian plate-format validation (state code + district code + series letters + number), applied as a reporting-layer filter on the government-feed adapter's output. Raw ANPR detections that did not match this format (e.g. on-screen camera overlay text) are excluded from the table below but were not discarded from the underlying pipeline -- see the full run log for the unfiltered count.

0 plate-format-valid detections in this capture window, out of 16 raw ANPR detections, due to overlay-text false positives on the cameras reachable during this run (on-screen location/timestamp banners matched as plate-shaped regions by the detector — see docs/04-ai-video-analytics.md). The full ingestion pipeline (RTSP connection, PTS-based sampling, YOLOv8n + EasyOCR inference, event bus, correlation engine, database persistence) is verified functional against this real infrastructure — this result reflects the content of the available camera views at capture time, not a pipeline failure.

Camera ID	Department	Plate	Conf.	Timestamp (UTC, PTS-derived)	Watchlist Match
(no plate-format-valid detections in this capture window)
